Abstract of JP9234963

PROBLEM TO BE SOLVED: To provide a heat-sensitive transfer recording medium, with which a clear image can be produced without developing thermal fusion at transferring even to a body to be transferred having no releasant such as silicone oil or the like for preventing the thermal fusion from developing at a sublimation transferring system and which is excellent in storage stability. **SOLUTION:** In a heat-sensitive transfer recording medium made of a base material 2 and an ink layer 1, which is laminated onto the base material and contains heat transferable dye and binder, the ink layer 1 contains 0.1-10.0wt.% of silicon-modified polymer. In this case, as the silicon-modified polymer, polymer modified by fatty acid-modified silicone, methoxy group-containing silicone or hydroxyl group-containing silicone is employed.
